

# Quantum criticality: where are we and where are we going ?

Subir Sachdev

*Harvard University*

Talk online at <http://sachdev.physics.harvard.edu>

# Outline

1. Density-driven phase transitions
  - A. Fermions with repulsive interactions
  - B. Bosons with repulsive interactions
  - C. Fermions with attractive interactions
2. Magnetic transitions of Mott insulators
  - A. Dimerized Mott insulators – Landau-Ginzburg-Wilson theory
  - B.  $S=1/2$  per unit cell: deconfined quantum criticality
3. Transitions of the Kondo lattice
  - A. Large Fermi surfaces – Hertz theory
  - B. Fractional Fermi liquids and gauge theory

# I. Density driven transitions

*Non-analytic change in a conserved density  
(spin) driven by changes in chemical  
potential (magnetic field)*

# 1.A Fermions with repulsive interactions

$$H = \sum_k (\varepsilon_k - \mu) c_{k\sigma}^\dagger c_{k\sigma}$$

+ short-range repulsive interactions of strength  $u$

# 1.A Fermions with repulsive interactions

## Characteristics of this ‘trivial’ quantum critical point:

- No “order parameter”. “Topological” characterization in the existence of the Fermi surface in one state.
- No transition at  $T > 0$ .
- Characteristic crossovers at  $T > 0$ , between quantum criticality, and low  $T$  regimes.
- Strong  $T$ -dependent scaling in quantum critical regime, with response functions scaling universally as a function of  $k^z/T$  and  $\omega/T$ , where  $z$  is the dynamic critical exponent.

# 1.A Fermions with repulsive interactions

Characteristics of this 'trivial' quantum critical point:

# 1.A Fermions with repulsive interactions

Characteristics of this ‘trivial’ quantum critical point:

RG flow characterizing quantum critical point:

$$\frac{du}{dl} = (2-d)u - \frac{u^2}{2}$$

- $d > 2$  – interactions are irrelevant. Critical theory is the *spinful* free Fermi gas.
- $d < 2$  – universal fixed point interactions. In  $d=1$  critical theory is the *spinless* free Fermi gas

## 1.B Bosons with repulsive interactions

$$\frac{du}{dl} = (2-d)u - \frac{u^2}{2}$$

- Describes field-induced magnetization transitions in spin gap compounds
- Critical theory in  $d = 1$  is also the *spinless* free *Fermi* gas.
- Properties of the dilute Bose gas in  $d > 2$  violate hyperscaling and depend upon microscopic scattering length (Yang-Lee).

## 1.C Fermions with attractive interactions

- Universal fixed-point is accessed by *fine-tuning* to a Feshbach resonance.
- Density onset transition is described by free fermions for weak-coupling, and by (nearly) free bosons for strong coupling. The quantum-critical point between these behaviors is the Feshbach resonance.

# 1.C Fermions with attractive interactions

# 1.C Fermions with attractive interactions

Universal theory of gapless bosons and fermions, with decay of boson into 2 fermions relevant for  $d < 4$

## 1.C Fermions with attractive interactions

Quantum critical point at  $\mu=0$ ,  $\nu=0$ , forms the basis of a theory which describes ultracold atom experiments, including the transitions to FFLO and normal states with unbalanced densities

# Outline

1. Density-driven phase transitions
  - A. Fermions with repulsive interactions
  - B. Bosons with repulsive interactions
  - C. Fermions with attractive interactions
2. Magnetic transitions of Mott insulators
  - A. Dimerized Mott insulators – Landau-Ginzburg-Wilson theory
  - B.  $S=1/2$  per unit cell: deconfined quantum criticality
3. Transitions of the Kondo lattice
  - A. Large Fermi surfaces – Hertz theory
  - B. Fractional Fermi liquids and gauge theory

## 2.A. Magnetic quantum phase transitions in “dimerized” Mott insulators:

*Landau-Ginzburg-Wilson (LGW) theory:*

*Second-order phase transitions described by fluctuations of an order parameter associated with a broken symmetry*

# LGW theory for quantum criticality

Landau-Ginzburg-Wilson theory: write down an effective action for the antiferromagnetic order parameter  $\vec{\phi}$  by expanding in powers of  $\vec{\phi}$  and its spatial and temporal derivatives, while preserving all symmetries of the microscopic Hamiltonian

$$S_{\phi} = \int d^2x d\tau \left[ \frac{1}{2} \left( (\nabla_x \vec{\phi})^2 + \frac{1}{c^2} (\partial_{\tau} \vec{\phi})^2 + (\lambda_c - \lambda) \vec{\phi}^2 \right) + \frac{u}{4!} (\vec{\phi}^2)^2 \right]$$

## 2.A. Magnetic quantum phase transitions in Mott insulators with $S=1/2$ per unit cell

*Deconfined quantum criticality*

Mott insulator with two  $S=1/2$  spins per unit cell

Mott insulator with one  $S=1/2$  spin per unit cell

Mott insulator with one  $S=1/2$  spin per unit cell

Ground state has Neel order with  $\vec{\phi} \neq 0$

## Mott insulator with one $S=1/2$ spin per unit cell

Destroy Neel order by perturbations which preserve full square lattice symmetry *e.g.* second-neighbor or ring exchange.

The strength of this perturbation is measured by a coupling  $g$ .

Small  $g \Rightarrow$  ground state has Neel order with  $\langle \varphi^{\mathbf{r}} \rangle \neq 0$

Large  $g \Rightarrow$  paramagnetic ground state with  $\langle \varphi^{\mathbf{r}} \rangle = 0$

## Mott insulator with one $S=1/2$ spin per unit cell

Destroy Neel order by perturbations which preserve full square lattice symmetry *e.g.* second-neighbor or ring exchange.

The strength of this perturbation is measured by a coupling  $g$ .

Small  $g \Rightarrow$  ground state has Neel order with  $\langle \varphi^{\mathbf{r}} \rangle \neq 0$

Large  $g \Rightarrow$  paramagnetic ground state with  $\langle \varphi^{\mathbf{r}} \rangle = 0$

Mott insulator with one  $S=1/2$  spin per unit cell

Possible large  $g$  paramagnetic ground state with  $\langle \hat{\phi}^{\mathbf{r}} \rangle = 0$

## Mott insulator with one $S=1/2$ spin per unit cell

Possible large  $g$  paramagnetic ground state with  $\langle \vec{\phi} \rangle = 0$

Such a state breaks the symmetry of rotations by  $n\pi/2$  about lattice sites,  
and has  $\langle \Psi_{\text{bond}} \rangle \neq 0$ , where  $\Psi_{\text{bond}}$  is the *bond order parameter*

$$\Psi_{\text{bond}}(i) = \sum_{\langle ij \rangle} \vec{S}_i \cdot \vec{S}_j e^{i \arctan(\vec{r}_j - \vec{r}_i)}$$

## Mott insulator with one $S=1/2$ spin per unit cell

Possible large  $g$  paramagnetic ground state with  $\langle \hat{\phi} \rangle = 0$

Such a state breaks the symmetry of rotations by  $n\pi/2$  about lattice sites, and has  $\langle \Psi_{\text{bond}} \rangle \neq 0$ , where  $\Psi_{\text{bond}}$  is the *bond order parameter*

$$\Psi_{\text{bond}}(i) = \sum_{\langle ij \rangle} \hat{S}_i^x \hat{S}_j^x e^{i \arctan(r_j - r_i)}$$

## Mott insulator with one $S=1/2$ spin per unit cell

Possible large  $g$  paramagnetic ground state with  $\langle \vec{\phi} \rangle = 0$

Such a state breaks the symmetry of rotations by  $n\pi/2$  about lattice sites,  
and has  $\langle \Psi_{\text{bond}} \rangle \neq 0$ , where  $\Psi_{\text{bond}}$  is the *bond order parameter*

$$\Psi_{\text{bond}}(i) = \sum_{\langle ij \rangle} \vec{S}_i \cdot \vec{S}_j e^{i \arctan(\vec{r}_j - \vec{r}_i)}$$

## Mott insulator with one $S=1/2$ spin per unit cell

Possible large  $g$  paramagnetic ground state with  $\langle \hat{\phi} \rangle = 0$

Such a state breaks the symmetry of rotations by  $n\pi/2$  about lattice sites,  
and has  $\langle \Psi_{\text{bond}} \rangle \neq 0$ , where  $\Psi_{\text{bond}}$  is the *bond order parameter*

$$\Psi_{\text{bond}}(i) = \sum_{\langle ij \rangle} \hat{S}_i^x \hat{S}_j^x e^{i \arctan(r_j - r_i)}$$

## Mott insulator with one $S=1/2$ spin per unit cell

Possible large  $g$  paramagnetic ground state with  $\langle \vec{\phi} \rangle = 0$

Such a state breaks the symmetry of rotations by  $n\pi/2$  about lattice sites,  
and has  $\langle \Psi_{\text{bond}} \rangle \neq 0$ , where  $\Psi_{\text{bond}}$  is the *bond order parameter*

$$\Psi_{\text{bond}}(i) = \sum_{\langle ij \rangle} \vec{S}_i \cdot \vec{S}_j e^{i \arctan(\vec{r}_j - \vec{r}_i)}$$

# Mott insulator with one $S=1/2$ spin per unit cell

Possible large  $g$  paramagnetic ground state with  $\langle \hat{\phi} \rangle = 0$

Another state breaking the symmetry of rotations by  $n\pi/2$  about lattice sites, which also has  $\langle \Psi_{\text{bond}} \rangle \neq 0$ , where  $\Psi_{\text{bond}}$  is the *bond order parameter*

$$\Psi_{\text{bond}}(i) = \sum_{\langle ij \rangle} \hat{S}_i^{\mathbf{r}} g \hat{S}_j^{\mathbf{r}} e^{i \arctan(\mathbf{r}_j - \mathbf{r}_i)}$$

# Mott insulator with one $S=1/2$ spin per unit cell

Possible large  $g$  paramagnetic ground state with  $\langle \hat{\phi} \rangle = 0$

Another state breaking the symmetry of rotations by  $n\pi/2$  about lattice sites, which also has  $\langle \Psi_{\text{bond}} \rangle \neq 0$ , where  $\Psi_{\text{bond}}$  is the *bond order parameter*

$$\Psi_{\text{bond}}(i) = \sum_{\langle ij \rangle} \hat{S}_i^{\mathbf{r}} g \hat{S}_j^{\mathbf{r}} e^{i \arctan(\mathbf{r}_j - \mathbf{r}_i)}$$

# Mott insulator with one $S=1/2$ spin per unit cell

Possible large  $g$  paramagnetic ground state with  $\langle \vec{\phi} \rangle = 0$

Another state breaking the symmetry of rotations by  $n\pi/2$  about lattice sites, which also has  $\langle \Psi_{\text{bond}} \rangle \neq 0$ , where  $\Psi_{\text{bond}}$  is the *bond order parameter*

$$\Psi_{\text{bond}}(i) = \sum_{\langle ij \rangle} S_i^{\mathbf{r}} g S_j^{\mathbf{r}} e^{i \arctan(\mathbf{r}_j - \mathbf{r}_i)}$$

# Mott insulator with one $S=1/2$ spin per unit cell

Possible large  $g$  paramagnetic ground state with  $\langle \vec{\phi} \rangle = 0$

Another state breaking the symmetry of rotations by  $n\pi/2$  about lattice sites, which also has  $\langle \Psi_{\text{bond}} \rangle \neq 0$ , where  $\Psi_{\text{bond}}$  is the *bond order parameter*

$$\Psi_{\text{bond}}(i) = \sum_{\langle ij \rangle} \vec{S}_i^{\mathbf{r}} g \vec{S}_j^{\mathbf{r}} e^{i \arctan(\mathbf{r}_j - \mathbf{r}_i)}$$

# Mott insulator with one $S=1/2$ spin per unit cell

Possible large  $g$  paramagnetic ground state with  $\langle \hat{\phi} \rangle = 0$

Another state breaking the symmetry of rotations by  $n\pi/2$  about lattice sites, which also has  $\langle \Psi_{\text{bond}} \rangle \neq 0$ , where  $\Psi_{\text{bond}}$  is the *bond order parameter*

$$\Psi_{\text{bond}}(i) = \sum_{\langle ij \rangle} S_i^{\mathbf{r}} g S_j^{\mathbf{r}} e^{i \arctan(\mathbf{r}_j - \mathbf{r}_i)}$$

# LGW theory of multiple order parameters

$$F = F_{\text{vbs}} [\Psi_{\text{vbs}}] + F_{\varphi} [\mathbf{\varphi}] + F_{\text{int}}$$

$$F_{\text{vbs}} [\Psi_{\text{vbs}}] = r_1 |\Psi_{\text{vbs}}|^2 + u_1 |\Psi_{\text{vbs}}|^4 + \mathbf{L}$$

$$F_{\varphi} [\mathbf{\varphi}] = r_2 |\mathbf{\varphi}|^2 + u_2 |\mathbf{\varphi}|^4 + \mathbf{L}$$

$$F_{\text{int}} = v |\Psi_{\text{vbs}}|^2 |\mathbf{\varphi}|^2 + \mathbf{L}$$

Distinct symmetries of order parameters permit couplings only between their energy densities

# LGW theory of multiple order parameters

# LGW theory of multiple order parameters

# Proposal of deconfined quantum criticality

VBS order  $\langle \Psi_{\text{vbs}} \rangle \neq 0$

(associated with condensation of monopoles in  $A_\mu$ ),

$S = 1/2$  spinons  $z_\alpha$  confined,

$S = 1$  triplon excitations

Neel order

$$\langle \mathbf{r} \rangle \sim \langle z_\alpha^* \boldsymbol{\sigma}_{\alpha\beta} z_\beta \rangle \neq 0$$

Second-order critical point described by

$$\mathcal{S}_{\text{critical}} = \int d^2x d\tau \left[ |(\partial_\mu - iA_\mu)z_\alpha|^2 + r |z_\alpha|^2 + \frac{u}{2} (|z_\alpha|^2)^2 + \frac{1}{4e^2} (\partial_\mu A_\nu - \partial_\nu A_\mu)^2 \right]$$

at its critical point  $r = r_c$ , where  $A_\mu$  is *non-compact*

## Theory of a second-order quantum phase transition between Neel and VBS phases

At the quantum critical point:

- $A_\mu \rightarrow A_\mu + 2\pi$  periodicity can be ignored  
(Monopoles interfere destructively and are dangerously irrelevant).
- $S=1/2$  spinons  $z_\alpha$ , with  $\vec{\varphi} \sim z_\alpha^* \vec{\sigma}_{\alpha\beta} z_\beta$ , are globally propagating degrees of freedom.

*Second-order critical point described by emergent fractionalized degrees of freedom ( $A_\mu$  and  $z_\alpha$ );  
Order parameters ( $\varphi$  and  $\Psi_{\text{vbs}}$ ) are “composites”  
and of secondary importance*

  - B. Fractional Fermi liquids and gauge theory

# The Kondo lattice

Local moments  $f_\sigma$

+

Conduction electrons  $c_\sigma$

$$H_K = \sum_{i < j} t_{ij} c_{i\sigma}^\dagger c_{j\sigma} + J_K \sum_i c_{i\sigma}^\dagger \tau_{\sigma\sigma'} c_{i\sigma} \cdot \mathbf{S}_{fi} + J \sum_{\langle ij \rangle} \mathbf{S}_{fi} \cdot \mathbf{S}_{fj}$$

Number of  $f$  electrons per unit cell =  $n_f = 1$

Number of  $c$  electrons per unit cell =  $n_c$

### 3.A. The heavy Fermi liquid (FL)

*Hertz theory for the onset of spin  
density wave order*

The “large” Fermi surface is obtained in the limit of large  $J_K$

The Fermi surface of heavy quasiparticles encloses a volume which counts *all* electrons.

$$\text{Fermi volume} = 1 + n_c$$

# Argument for the Fermi surface volume of the FL phase

Single ion Kondo effect implies  $J_K \rightarrow \infty$  at low energies

Fermi liquid of  $S=1/2$  holes with hard-core repulsion

$$\begin{aligned} \text{Fermi surface volume} &= -(\text{density of holes}) \bmod 2 \\ &= -(1 - n_c) = (1 + n_c) \bmod 2 \end{aligned}$$

# LGW (Hertz) theory for QCP to SDW order

Write down effective action for SDW order parameter  $\phi$

$\phi$  fluctuations are damped  
by mixing with fermionic  
quasiparticles near the Fermi surface

$$S_\phi = \int \frac{d^d q d\omega}{(2\pi)^{d+1}} |\phi(q, \omega)|^2 (q^2 + |\omega| + (J_K - J_{Kc})) + \frac{u}{4} \int d^d r d\tau (\phi^2)^2$$

Fluctuations of  $\phi$  about  $\phi = 0 \Rightarrow$  paramagnons

- J. Mathon, *Proc. R. Soc. London A*, **306**, 355 (1968); T.V. Ramakrishnan, *Phys. Rev. B* **10**, 4014 (1974);  
M. T. Beal-Monod, *Phys. Rev. B* **14**, 1165 (1976).  
T. Moriya, *Phys. Rev. B* **12**, 1141 (1975);  
G. G. Lonzarich and L. Taillefer, *J. Phys. C* **18**, 4559 (1985); A.J. Millis, *Phys. Rev. B* **48**, 7183 (1993).

No Mottness

## 3.B. The Fractionalized Fermi liquid (FL\*)

*Phases and quantum critical points  
characterized by gauge theory and  
“topological” excitations*

Work in the regime with small  $J_K$ , and consider  
destruction of magnetic order by frustrating  
(RKKY) exchange interactions between  $f$  moments

A spin liquid ground state with  $\langle \vec{\phi}^{\mathbf{r}} \rangle = 0$  and no broken lattice symmetries.

Such a state has emergent excitations described by a  $Z_2$  or  $U(1)$  gauge theory

P. Fazekas and P.W. Anderson, *Phil Mag* **30**, 23 (1974).

N. Read and S. Sachdev, *Phys. Rev. Lett.* **66**, 1773 (1991);

X. G. Wen, *Phys. Rev. B* **44**, 2664 (1991).

## Influence of conduction electrons

Local moments  $f_\sigma$

+

Conduction electrons  $c_\sigma$

$$H = \sum_{i < j} t_{ij} c_{i\sigma}^\dagger c_{j\sigma} + \sum_i \left( J_K c_{i\sigma}^\dagger \vec{\tau}_{\sigma\sigma'} c_{i\sigma'} \cdot \vec{S}_{fi} \right) + \sum_{i < j} J_H(i, j) \vec{S}_{fi} \cdot \vec{S}_{fj}$$

Determine the ground state of the quantum antiferromagnet defined by  $J_H$ , and then couple to conduction electrons by  $J_K$

Choose  $J_H$  so that ground state of antiferromagnet is a  $Z_2$  or  $U(1)$  spin liquid

## Influence of conduction electrons

Local moments  $f_\sigma$

+

Conduction electrons  $c_\sigma$

At  $J_K=0$  the conduction electrons form a Fermi surface on their own with volume determined by  $n_c$ .

Perturbation theory in  $J_K$  is regular, and so this state will be stable for finite  $J_K$ .

So volume of Fermi surface is determined by  $(n_c+n_f-1)=n_c \pmod{2}$ , and does not equal the Luttinger value.

The (U(1) or  $Z_2$ ) FL\* state

## A new phase: FL\*

This phase preserves spin rotation invariance, and has a Fermi surface of *sharp* electron-like quasiparticles.

The state has “*topological order*” and associated neutral excitations. The topological order can be detected by the violation of Luttinger’s Fermi surface volume. It can only appear in dimensions  $d > 1$

$$2 \times \frac{V_0}{(2\pi)^d} (\text{Volume enclosed by Fermi surface}) \\ = (n_f + n_c - 1) \pmod{2}$$

Precursors: N. Andrei and P. Coleman, *Phys. Rev. Lett.* **62**, 595 (1989).

# Phase diagram

# Phase diagram

Fractionalized Fermi liquid with moments paired in a spin liquid. Fermi surface volume does not include moments and is unequal to the Luttinger value.

U(1) FL\*

FL

$\langle b \rangle = 0$ , Deconfined

$J_{Kc}$

$\langle b \rangle \neq 0$ , Higgs

$J_K$

# Phase diagram

Fractionalized Fermi liquid with moments paired in a spin liquid. Fermi surface volume does not include moments and is unequal to the Luttinger value.

U(1) FL\*

“Heavy” Fermi liquid with moments Kondo screened by conduction electrons. Fermi surface volume equals the Luttinger value.

FL

$\langle b \rangle = 0$ , Deconfined

$J_{Kc}$

$\langle b \rangle \neq 0$ , Higgs

$J_K$

# Phase diagram

Fractionalized Fermi liquid with moments paired in a spin liquid. Fermi surface volume does not include moments and is unequal to the Luttinger value.

U(1) FL\*

“Heavy” Fermi liquid with moments Kondo screened by conduction electrons. Fermi surface volume equals the Luttinger value.

FL

$\langle b \rangle = 0$ , Deconfined

$J_{Kc}$

$\langle b \rangle \neq 0$ , Higgs

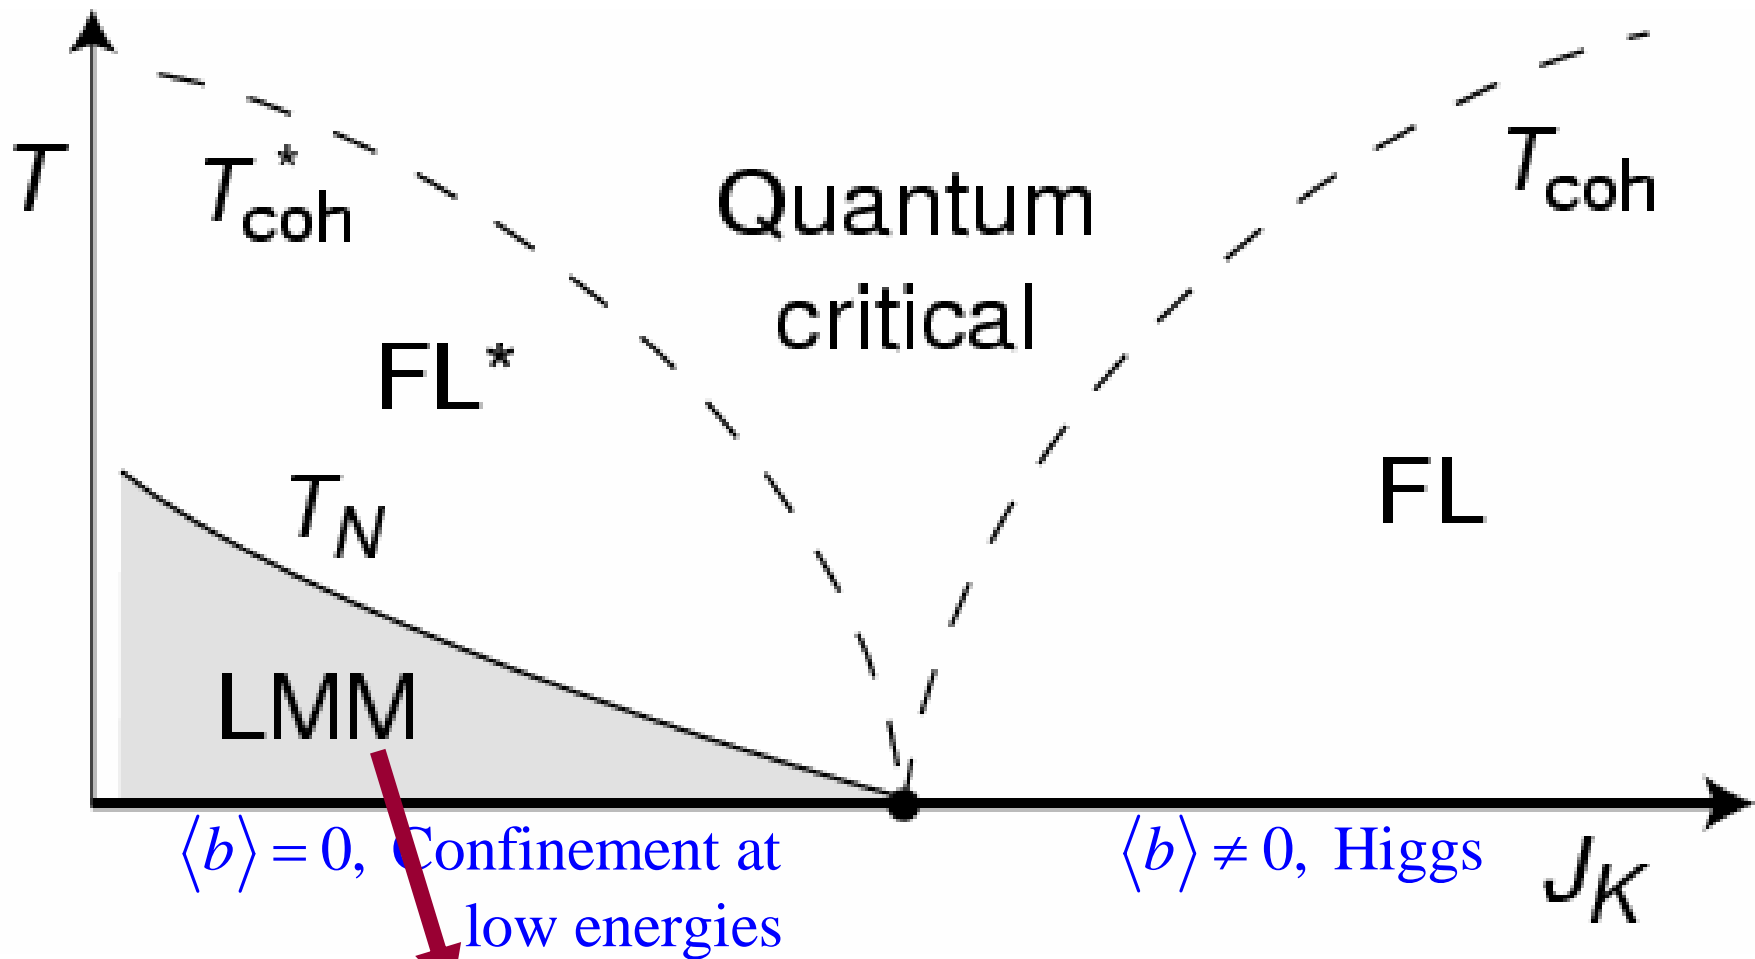

$J_K$

Sharp transition at  $T=0$  in compact U(1) gauge theory

# Phase diagram

# Deconfined criticality in the Kondo lattice ?

Local moment magnetism: magnetism appears by spontaneous polarization of f moments (c electrons remain spectators).  
Distinct from SDW order in FL state. **Includes Mottness**

# Deconfined criticality in the Kondo lattice ?

U(1) FL\* phase generates magnetism at energies much lower than the critical energy of the FL to FL\* transition

## Conclusions

1. Good experimental and theoretical progress in understanding density-driven and LGW quantum phase transitions.
2. Many interesting transitions of strongly correlated materials associated with gauge or “topological” order parameters. Intimate connection with Luttinger theorem and lattice commensuration effects. Classification scheme ?
3. Many experiments on heavy fermions compounds and cuprates remain mysterious – effects of disorder ?
4. Ultracold atoms offer new regime for studying many quantum phase transitions.
